Modernization

Acceleration

Embedded BNPL and automated onboarding achieved **85% faster deployment** and a **35% increase in checkout approvals**.

Frictionless CX with BNPL

Acceleration

Enabled borderless payment scaling from the US to EU with integrated risk remediation, achieving **50% faster security flaw fixing**.

Scaling payments + Compliance

Productivity

Centralized customer service with intelligent routing reduced manual agent intervention by 60% and achieved **40% operational cost savings**.

Customer service transformation

Innovation

Unified AI-led automation strategy accelerated testing framework migration by 70% and achieved **60% efficiency gains** in test script conversion.

AI-powered quality engineering

Modernization

Payment platform modernization and microservices architecture delivered **99.99% availability and 5x higher data throughput**.

Payments modernization

Acceleration

Innovation

Optimized the product engineering lifecycle across the enterprise, achieving **4x acceleration** in product delivery and **70% automation coverage**.

Product development acceleration

Case Study:

Frictionless CX with embedded finance

E-commerce & agentic commerce platform integration through open API

The Challenge:

Fragmented checkout experiences and manual merchant onboarding hindered growth. The client needed a scalable, universal blueprint to seamlessly embed **BNPL financing** across diverse e-commerce platforms like Shopify and WooCommerce.

Transformation Goals:

- **Universal Commerce Adoption:** Establish a plug-and-play architecture for Shopify, WooCommerce, and future digital storefronts.
- **Zero-Friction Onboarding:** Automate underwriting and credentialing to radically reduce merchant time-to-market.
- **Optimized Consumer Journey:** Deliver real-time, in-cart loan decisioning to boost conversion rates.
- **Future-Proof Extensibility:** Build a robust, API-first foundation to handle complex transaction lifecycles at scale.

Solution Approach:

Myridius delivered an API-driven e-commerce modernization framework to seamlessly embed BNPL financing.

- › **Omnichannel Plugin Architecture**
Engineered a modular, API-driven plugin framework initially for Shopify, which established core, reusable architectural blueprint for subsequent platform rollouts.
- › **Automated Merchant Onboarding, Underwriting and Risk Assessment**
Integrated robust Salesforce API workflows to automate merchant underwriting, risk assessment & secure API credential provisioning the moment plugin is installed.
- › **Seamless Checkout & Lifecycle Automation**
Embedded full consumer loan application directly into the checkout flow, using real-time webhooks to automatically synchronize cart recalculations, funding disbursements, voids, and refunds.

Tech Stack Leveraged

Key Outcomes

3x

Faster multi-platform BNPL plugin deployment

85%

Faster merchant onboarding with automated CRM synchronization

35%

Increase in checkout with instant POS BNPL approvals

Case Study:

Time to market & cost of quality optimization

AI-driven testing framework and agentic migration to enable tools consolidation

The Challenge:

The client faced critical bottlenecks in their quality assurance lifecycle across multiple merchant portals and onboarding gateways. Their testing infrastructure was fragmented across legacy automation frameworks which limited their ability to support comprehensive UI and API testing, severely restricting team capacity and preventing QE team from keeping pace with agile sprint timelines.

Transformation Goals:

- **Framework Consolidation:** Migrate disparate automation assets into a single, robust architecture to support both UI and API testing seamlessly.
- **GenAI-Accelerated Automation:** Leverage AI to rapidly convert legacy code and automate repetitive web-element mapping.
- **Zero-Backlog Sprints:** Radically reduce test script creation time to align QA velocity with aggressive software development lifecycles.
- **Team Enablement:** Upskill the engineering workforce to autonomously utilize AI pair-programming tools and modern testing frameworks.

Solution Approach:

Myridius implemented a GenAI-powered automation strategy to seamlessly unify testing frameworks and accelerate enterprise test script generation.

› QA Framework Unification

Evaluated fragmented automation landscape and successfully migrated complex regression suites from Serenity and Eggplant into a unified, end-to-end Karate framework, ensuring total functional integrity across UI and API layers.

› AI-Led Script Migration & Creation

Translated legacy scripts to Karate. Automatically identified & mapped web elements as page objects directly from TestRail cases, eliminating manual coding.

› Comprehensive Client Enablement

Conducted hands-on training sprints to familiarize the client's engineering teams with Karate implementation ensuring smooth adoption, sustained productivity

Tech Stack Leveraged

Case Study:

Global expansion enablement

Platform modernization & scalability including integrated UX, BI and payments compliance

The Challenge:

The client needed to modernize its legacy merchant payment systems to support a rapidly expanding global footprint. The client required a unified strategy to consolidate its diverse product suite, accelerate development cycles, and deliver a frictionless, highly secure experience for merchants scaling from the U.S. into European markets.

Transformation Goals:

- **Omnichannel Payment Unification:** Simplify payment flows by integrating diverse modes including Digital Wallets, Buy Now Pay Later (BNPL), POS, and card processing into a cohesive ecosystem.
- **AI-Driven Development Velocity:** Harness agentic AI and intelligent tooling to accelerate product development
- **Global Scalability & UX Uplift:** Expand automated merchant onboarding capabilities into EU countries while delivering superior UX
- **Compliance & Risk Mitigation:** Ensure robust, continuous compliance (PCI, Card Associations) via advanced encryption, tokenization, etc.

Solution Approach:

Myridius executed a scalable, AI-powered modernization roadmap to unify global merchant payment systems and ensure rigorous regulatory compliance.

- › **Payment Flow Simplification & API Orchestration**
Consolidated diverse payment modes (BNPL, wallets, cards) into a single modernized suite, automating workflows and dramatically simplifying UX
- › **Merchant Intelligence**
Upgraded business intelligence to provide stakeholders with real-time transaction analytics to optimize revenue and strategic growth.
- › **Secure Borderless Scaling & Continuous Remediation**
Architected a future-ready infrastructure for seamless U.S. to EU merchant expansion, embedding PCI-compliant tokenization and automated vulnerability scanning to ensure secure, borderless operations.

Tech Stack Leveraged

Key Outcomes

30%

Accelerated merchant onboarding with automated workflows

30%

Improved productivity across engineering lifecycle

50%

Faster remediation for identified vulnerabilities

Case Study:

Market agility through platform modernization

Rearchitected platform for microservices and continuous delivery & enhanced resilience

The Challenge:

The client operated a highly complex, fragmented product ecosystem characterized by legacy monolithic applications and decentralized engineering practices. Disconnected data pipelines across onboarding portals, core processing gateways, and POS terminal systems severely hindered scalability. This compounding technical debt created friction in high-throughput data processing, limited the delivery of real-time analytics, and constrained the enterprise's ability to rapidly deploy cross-functional features without risking system stability.

Transformation Goals:

- **Architectural Decoupling:** Dismantle monolithic legacy systems into an agile, API-first microservices architecture to eliminate operational silos.
- **Continuous Engineering:** Implement ubiquitous CI/CD pipelines and shift-left automation to ensure rapid, zero-defect software deployments.
- **Data Flow Modernization:** Overhaul complex data ingestion pipelines to process massive transaction volumes and enable real-time analytics.
- **End-to-End Resilience:** Robust, multi-layered validation frameworks spanning cloud-native software to physical terminal integrations.

Solution Approach:

Myridius led a comprehensive engineering transformation to standardize enterprise architecture, optimize data pipelines, and fortify systemic resilience.

- › **Microservices Architecture & API Orchestration**
Re-architected core processing gateways and enterprise portals into scalable microservices ecosystem enabling engineering pods to accelerate feature dev.
- › **Shift-Left DevSecOps & Continuous Delivery**
Embedded automated CI/CD pipelines with rigorous security guardrails (SonarQube, Veracode, Checkmarx) directly into the code-commit lifecycle.
- › **E2E Platform Resilience & Pipeline Modernization**
Modernized critical data ingestion streams across enterprise databases (DB2, Oracle) to power zero-latency reporting engines. Concurrently executed sophisticated validation strategies combining UI, API, and physical hardware simulators

Tech Stack Leveraged

Key Outcomes

60%

Swifter feature delivery with compressed release cycles

5x

Higher data throughput with modernized data pipelines

99.99%

High availability & seamless failover under extreme load conditions

Case Study:

Client onboarding simplification

Self-service & automation with ServiceNow including complex enterprise integration

The Challenge:

The client faced delayed issue resolution, inconsistent service quality, and a lack of operational visibility due to fragmented, manual processes across emails, phone calls, and siloed systems. Customers frequently struggled to track request statuses, while the manual enrollment of carriers and coordination of training schedules led to significant inefficiencies, poor SLA adherence, and elevated operational costs. The client urgently needed a centralized, scalable platform to streamline communication and automate core workflows..

Transformation Goals:

- **Unified CX:** Replace fragmented workflows with a secure, and centralized self-service portal for communication, case management & onboarding.
- **Operational Automation:** Automate manual tasks such as carrier onboarding, record updates, ticket creation to reduce turnaround times.
- **Knowledge & Learning Consolidation:** Centralize scattered knowledge base into integrated, self-paced hubs to preserve enterprise knowledge.
- **Enhanced Visibility & SLA Tracking:** Implement real-time dashboards to improve SLA compliance, proactive issue management & data accuracy.

Solution Approach:

Myridius implemented a centralized, automated ServiceNow CSM framework to seamlessly unify self-service, freight onboarding, and knowledge management.

› Centralized Self-Service & Automated Onboarding

Designed and deployed the Freight Customer Service Portal using ServiceNow CSM to consolidate all customer interactions into a single system.

› Intelligent Routing & Agent Workspace

Intelligently routed cases to designated Live Agents, significantly reducing manual triage. Specialized Agent Workspaces enabling to accelerate resolution times.

› Integrated Knowledge & Training Ecosystem

Engineered custom portals and widgets to unify Freight Knowledge Base articles, E-Learning videos, User Guides, and Scheduled Trainings into a centralized hub. This transitioned the client to a scalable, on-demand, remote learning environment.

Tech Stack Leveraged

Key Outcomes

**360°
Visibility**
End-to-end tracking of SLA compliance

60%
Reduction in manual agent intervention via auto routing

40%
Decrease in operational support costs

Guest & cast experience modernization

Myridius elevated guest and cast experiences by modernizing applications powered by AI-led engineering

Engagement Snapshot

LOBs engaged

Disney client stories | caselets

Modernization

Reimagined the end-to-end dining experience resulting in **>32% revenue uplift**

Intelligent yield management

Innovation

99.95% system uptime through AI-assisted triage and self-healing resolutions

SRE workflow automation

Acceleration

Migrated legacy websites with Adobe EDS & Cursor reducing **50% effort** in component development

AI-led AEM migration

Sustainment

24/7 Level 3 support across 100+ applications with **Zero SLA breaches** over the last two years

Robust reliable support

Modernization

Trip Services API modernization to **enhance functionality** & address the challenges posed by outdated technology (Django/Python)

Technical debt reduction

Automation

Automated data collection & report generation for executive decision-making reducing report preparation time **from a week to 10 min**

Chairman's report automation

Case Study:

Dining experience & yield transformation

AWS native modernization, channel redesign and advanced intelligence & data integration

The Challenge:

Disney needed to evolve its dining and activity reservation environment beyond its existing foundation to better serve both guests and staff. The desired state was a **modern reservation experience & revenue yield optimization** with stronger UX/UI, simplified internal tools, and revenue-driving capabilities that could improve booking efficiency, reduce errors, and support more profitable demand management.

Transformation Goals:

- **Enhance Guest Experience:** Elevate the guest booking experience with more intuitive, industry-standard reservation capabilities.
- **Improve Operations:** Simplify cast operations by replacing legacy-facing tools with modern booking and maintenance applications.
- **Optimize Revenue:** Introduce yield management capabilities and business rules to maximize guest counts and profitability.

Solution Approach:

Myridius delivered a multiyear modernization program to enhance dining and activity reservations through automation, experience redesign, and operational simplification.

- › **Enhanced UX/UI & Booking Capabilities**
Redesigned guest experience and introduced industry-standard booking features, including search across a date range.
- › **Modernized Cast-facing Applications**
Replaced legacy tools with modern applications to simplify product search, booking, configuration, and maintenance.
- › **Advanced Yield Management**
Implemented modern yield management capabilities, business rules, and end-to-end automated quality assurance to strengthen efficiency and revenue performance.

Tech Stack Leveraged

Key Outcomes

>32%

Revenue uplift by intelligent yield management

65%

Faster processing ensuring seamless reservations

3x

Increase in guest capacity with enhanced reliability

Case Study:

Business-IT resilience & operational efficacy

Multi AI agent SRE and resource management solution built on n8n

The Challenge:

Disney faced growing **operational blind spots** while managing millions of daily guest interactions across dining, resort, and mobile ordering platforms. Siloed telemetry across distributed microservices, inconsistent correlation identifiers, and manual incident reconstruction created prolonged MTTR and limited journey-level visibility – making scalable, proactive platform management operationally unsustainable.

Transformation Goals:

- **Unified Telemetry:** Consolidate and standardize log ingestion across distributed microservices to eliminate observability silos and enable consistent, co-relatable data streams.
- **Lifecycle Visibility:** Establish end-to-end booking journey visibility with real-time KPIs and funnel dashboards across dining, resort, and mobile channels.
- **AI-Driven Triage:** Implement predictable, automated incident workflows powered by AI to accelerate detection, triage, and resolution at scale.

Solution Approach:

Myridius modernized the client's observability stack on Splunk, leveraging n8n to orchestrate AI-assisted triage and self-healing workflows — converting reactive incident management into a proactive, intelligence-driven operational model.

› Observability Foundation

Consolidated distributed microservice logs into Splunk with standardized correlation identifiers and real-time funnel dashboards.

› AI-Orchestrated Triage

Deployed n8n to automate log ingestion, anomaly detection, and incident escalation workflows.

› Self-Healing Automation

Enabled autonomous service restarts and cache flushes to minimize manual operational intervention.

Tech Stack Leveraged

n8n

Key Outcomes

60%

Faster incident triage dramatically reducing MTTR

99.95%

System uptime through self-healing resolutions

Proactive

AI-driven early-warning anomaly detection

Case Study:

Guest traffic leakage avoidance

AI-driven migration of 12+ websites to Adobe Edge Delivery Services

The Challenge:

Legacy websites had accumulated **significant technical debt**, making maintenance, updates, and standards adherence increasingly difficult. Performance also degraded during high-traffic events. The desired state was a faster, edge-first digital platform that could improve responsiveness, simplify authoring, accelerate feature delivery, and support accessible, reliable guest-facing experiences at scale.

Transformation Goals:

- **Technical Debt Reduction:** Migrate legacy websites to Adobe Edge Delivery Services to modernize the technology foundation.
- **Enhance Developer Velocity:** Increase speed of reusable component development and serverless middleware delivery without compromising enterprise standards.
- **Improve Scalability:** Strengthen platform scalability, accessibility, and resilience for high-traffic engagement and event-driven marketing experiences.

Solution Approach:

Myridius paired Adobe Edge Delivery Services migration with AI-assisted engineering, using Cursor to accelerate delivery while developers remained responsible for architecture, validation, and enterprise integration.

- › **AI-Assisted Component Development**
Used Cursor to scaffold EDS blocks, CSS, tests, and documentation from natural-language prompts aligned to organizational standards.
- › **Accelerated Middleware Engineering**
Generated AWS Lambda handlers, API integration templates, secrets-management patterns, and edge-compute stubs to speed backend development.
- › **Automated Configuration and Deployment**
Reduced manual effort through generated environment templates, routing rules, and Harness deployment definitions.

Tech Stack Leveraged

Key Outcomes

50%

Reduction in component development effort

70%

Defect reduction via improved linting guidance

Faster

QA cycles and improved code consistency

Case Study:

Legacy Modernization with Azure

Azure modernization blueprint enabling API-based CRS integration and advanced analytics

The Challenge:

The client needed to modernize a legacy inventory and revenue management system while integrating with a new central reservation system. The status quo relied on legacy interfaces and limited analytics. The desired state required modern API connectivity, an Azure migration MVP plan with C-level justification, and an analytics uplift to improve decisions.

Transformation Goals:

- **API Integration:** Enable modern API-based integration between legacy platform and the new central reservation system.
- **Azure Migration Strategy:** Define an Azure migration MVP plan with clear rationale for executive alignment.
- **Analytics Enablement:** Strengthen data and analytics capabilities to optimize inventory and revenue decisions.

Solution Approach:

Myridius partnered with the client's Enterprise Architecture team to deliver a comprehensive modernization blueprint – sequencing API integration, Azure migration planning, & analytics into an executive-ready transformation narrative.

- › **API Blueprint**
Defined target-state integration patterns for CRS connectivity.
- › **Azure MVP Plan**
Produced migration stages and MVP justification for C-level presentations.
- › **Data Strategy**
Established the analytics opportunity blueprint to improve decision-making.

Tech Stack Leveraged

Key Outcomes

Modernized

EA aligned blueprint enabling transition to an API-enabled target state

Approved

C-suite focused migration strategy supported by a clear MVP & value justification

Optimized

Analytics-driven path to enhance inventory visibility & revenue performance

Case Study:

Web architecture standardization

Unified web architecture roadmap and governance to enable cross-brand component reuse

The Challenge:

Client's web presence was fragmented across brands with no common architecture, making component sharing difficult and costly. This lack of standardization resulted into slowed delivery, increased redundant build effort, and constrained innovation

Transformation Goals:

- **Architecture Standardization:** Define a scalable target architecture to support multiple cruise brands.
- **Governance Enablement:** Establish architectural controls to drive consistency and component reuse.
- **Modernization Roadmap:** Deliver a phased transformation plan to reduce complexity and long-term development costs.

Solution Approach:

Myridius delivered an advisory engagement to design a new, unified web architecture and modernization roadmap. We assessed the current state, arch. requirements & the future-state blueprint for this multi-phase transformation

- › **Web architecture redesign & roadmap**
Documented architecture requirements, assessed the current state, and defined a scalable future state..
- › **Architecture governance**
Established standards and decision rights to maintain consistency across brands and teams.
- › **Phased implementation plan**
Produced a complete roadmap to guide a full rewrite and enable shared, reusable components across brands.

Tech Stack Leveraged

Key Outcomes

Standard

Reusable components across brands

Aligned

Unified modernization strategy with clear roadmap

Efficient

Faster delivery, consistent experiences across brands

Case Study:

Scaling QA with test automation

Redesigned QA and automated regression to stabilize mobile app quality and speed releases

The Challenge:

Client had defective mobile apps, which were driving guest dissatisfaction and a sub-par customer experience. Gaps in the existing QA process allowed defects to leak into production, while low test automation coverage increased time-to-market for web, mobile, and shipboard applications. Manual regression testing cycles delayed launches and constrained release velocity.

Transformation Goals:

- **Defect prevention:** Reduce production defects through stronger QA governance and disciplined regression testing.
- **Release acceleration:** Increase automation coverage to enable faster and more reliable releases across platforms.
- **Testing efficiency:** Lower regression effort and execution costs while improving overall software quality.

Solution Approach:

Myridius performed an exhaustive assessment of client's QA process to diagnose root causes of production defects and redesign regression execution. We introduced QA program-management approach & expanded automated testing across channels

- › **QA assessment & operating model**
Reviewed existing QA process gaps, identified root causes, and recommended improvements to regression strategy and program management.
- › **Integration & acceptance testing streamlining**
Improved testing workflow for customer-facing web and native mobile applications.
- › **Regression automation at scale**
Automated 90%+ of the existing regression suite test cases to reduce manual effort and accelerate release readiness

Tech Stack Leveraged

Key Outcomes

90%+

Regression suite automated

90%

Reduction in regression costs

12x

Faster regression execution cycles

Product & compliance engineering excellence

Delivering modern platforms, regulatory scale, and dedicated support to accelerate Insurity's market leadership

Migration of Insurity's Sure Commercial Policy Administration platform from Azure Cloud Services to Azure Service Fabric impacting **45 customer implementations**

Rewiring platform

Case Study:

Perpetual compliance assurance

Cloud native automation of regulatory compliance for regulatory & bureau changes

The Challenge:

Insurity faced a major operational bottleneck in managing regulatory compliance across multiple jurisdictions. A team of ~200 regulatory analysts manually extracted and analyzed data from complex, variable insurance circulars, driving high effort and cost. Leadership needed to **optimize operations** while ensuring accuracy and scalability in a rapidly evolving regulatory landscape.

Transformation Goals:

- **Regulatory Excellence at Scale:** Process and implement high volumes of bureau circulars with speed, accuracy, and consistency.
- **Comprehensive Coverage Enablement:** Support regulatory compliance across multiple lines of business and jurisdictions.
- **Accelerated Carrier Adoption:** Enable rapid and seamless adoption of regulatory updates across individual carrier environments.

Solution Approach:

Myridius executed a structured automation program combining process intelligence with agile delivery to transform compliance workflows.

- › **Process Intelligence and Mapping**
Analyzed annual bureau circulars from ISO, NCCI, AAIS, and independent bureaus to define automation rules and opportunities.
- › **Flexible Automation Framework**
Built a parameterized system to ingest and interpret circulars across formats, lines of business, and jurisdictions.
- › **Platform Integration**
Translated regulatory updates into base system implementations within Insurity's Policy Decisions platform to ensure accurate, market-ready content.

Tech Stack Leveraged

Key Outcomes

3,000+

Regulatory & bureau changes implemented annually

98%

On-time release commitment attainment

11K+

Customers compliance adoptions delivered annually

Case Study:

Resilient & reliable end-client operations

White-labelled premium product services for Insurity's end carrier/broker clients

The Challenge:

Insurity needed a scalable yet highly **personalized support model** to meet the unique and evolving needs of its customers. Traditional shared support structures often lacked continuity, deep customer context, and responsiveness, limiting the ability to drive faster enhancements, resolve issues efficiently, and align technology outcomes with business priorities.

Transformation Goals:

- **Personalized Support Model:** Establish dedicated teams aligned to individual customer environments and business needs.
- **Enhanced Delivery Continuity:** Improve consistency, responsiveness, and domain understanding across long-term engagements.
- **Stronger Business Alignment:** Ensure technology enhancements & support activities are closely aligned with customer priorities and outcomes.

Solution Approach:

Myridius enabled a high-touch Premium Support Team (PST) model, integrating domain expertise, product knowledge, and delivery excellence to create a seamless customer experience.

- › **Dedicated Customer-Centric Teams**
Deployed Myridius resources across Business Analysis, Development, QA, and Support to function as an extension of the customer organization.
- › **Long-Term Engagement Model**
Enabled teams to develop in-depth understanding of customer processes, configurations, and custom implementations.
- › **Unified Delivery Framework**
Operated as a cohesive unit with Insurity to provide consistent, high-quality support and accelerate enhancement delivery and issue resolution.

Tech Stack Leveraged

Key Outcomes

100%
On-time delivery

57%
Backlog reduction

53%
Increase in delivery throughput

Case Study:

Product growth through delivery at scale

Product implementation COE model for Insurity delivering across clients

The Challenge:

Insurity needed a scalable engineering and support model to drive innovation, sustain mission-critical platforms, and support diverse product lines across policy, claims, data, and geospatial solutions. Balancing modernization, customer-driven enhancements, and high-quality support while maintaining performance and continuity was critical to sustaining growth and customer satisfaction.

Transformation Goals:

- **Scalable Engineering Capacity:** Enable flexible delivery across multiple product lines and strategic initiatives.
- **Accelerated Modernization:** Support platform upgrades, cloud transformation, and data migration with minimal disruption.
- **Integrated Support Excellence:** Deliver seamless Tier 1 - 3 support to ensure high service quality and customer satisfaction.

Solution Approach:

Myridius deployed a comprehensive COE model with emphasis on engineering, quality and application services, combining deep product knowledge, domain expertise, and full-spectrum delivery capabilities.

- › **ERC Integration**
Leading development of Insurity's integration with Verisk's Electronic Rating Content (ERC) platform to for regulatory content automation.
- › **Advanced Integration and Cloud Modernization**
Supporting cloud modernization by leveraging Azure-based architectures, modern integration frameworks, and multi-tenant design patterns.
- › **Data Migration**
Delivering data migration solutions that will enable a carrier to transition from legacy claims systems to the ClaimsXpress platform.

Tech Stack Leveraged

Key Outcomes

Expanded

Product capabilities through strategic enhancements, innovation efforts

Faster

Delivery with reusable data migration frameworks

Improved

Operational efficiency and reliability

Case Study:

Workers' comp standardization

BCR-aligned Workers' comp product using templated rules, rates, and workflows

The Challenge:

Origami needed to transition from highly customized, cost-intensive implementations to a **scalable, standardized Workers' Compensation product**. The challenge was to create a reusable, end-to-end solution while maintaining flexibility for regulatory changes and client-specific deviations.

Transformation Goals:

- **Product Standardization:** Establish a reusable Workers' Compensation product for multi-client adoption.
- **Faster Deployments:** Reduce implementation timelines through a templated product foundation.
- **Flexible Compliance Model:** Enable regulatory updates and client-specific configurations without breaking the core standard.

Solution Approach:

Myridius leveraged Bureau Central Repository (BCR) expertise and domain-driven design to build a scalable, standards-based product foundation.

- › **Discovery-Driven Design**
Conducted structured workshops to define workflows, UI, reporting, and product requirements.
- › **Structured Requirements Engineering**
Developed detailed BRDs covering rules, rates, forms, UI, and reporting frameworks.
- › **Gap-Led Product Evolution**
Identified and prioritized product gaps to guide roadmap execution and future scalability.

Tech Stack Leveraged

Key Outcomes

Standard

Product blueprint for end-to-end Workers' comp solution

Reduced

Implementation effort, deployment time & cost

Faster

Onboarding of new clients

Case Study:

Scaled production support optimization

SLA-driven support using standardized processes, QA rigor, and AI-assisted development

The Challenge:

Origami needed to scale production support across ~40 client implementations while maintaining strict SLA commitments. The existing model required balancing maintenance, enhancements, and defect resolution, with a need to **improve efficiency, quality, and cost** while strengthening client satisfaction.

Transformation Goals:

- **Scalable Support Model:** Enable consistent L2 support and enhancement delivery across a growing client base.
- **Quality and Reliability Uplift:** Improve configuration accuracy, testing rigor, and defect resolution outcomes.
- **Cost-Optimized Delivery:** Reduce operational costs through automation and AI-assisted development practices.

Solution Approach:

Myridius implemented a structured production support model combining delivery discipline, platform expertise, and quality engineering.

- › **SLA-Aligned Support Delivery**
Provided consistent L2 production support and enhancements aligned to US business hours and SLA expectations.
- › **Configuration and Maintenance Excellence**
Managed policy forms, rate updates, and platform configurations to ensure system accuracy and stability.
- › **Quality Engineering and AI Enablement**
Strengthened manual and automated testing while leveraging AI-assisted coding (MS Copilot) to accelerate updates and improve code quality.

Case Study:

Onboarding via FSC Data Migration

Migrated datasets into Salesforce Financial Services Cloud & standardizing data models.

The Challenge:

The client needed to merge acquired-company datasets into a single, **standardized operating model**. The status quo included fragmented records, redundant fields, and inconsistent structures that increased audit/compliance risk and limited portfolio-wide reporting. The desired state required an FSC-aligned data model with automated validation and rationalized record types to enable reliable onboarding and client visibility.

Transformation Goals:

- **Compliance-Grade Accuracy:** Ensure policy, account, and referral integrity for audit readiness.
- **FSC Standardization:** Migrate acquired data sets into a unified Salesforce FSC data model.
- **Model Simplification:** Consolidate record types and redundant fields into a streamlined structure.

Solution Approach:

Myridius executed a phased, business-aligned migration into Salesforce FSC, pairing model rationalization with automated reconciliation to ensure data trustworthiness.

- › **Automated Validation**
Built scripts to compare legacy vs. target counts and key metrics.
- › **Data Model Mapping**
Defined object/field mapping across Accounts, Contacts, Opportunities, Policies, Referrals, Relationships.
- › **Structure Standardization**
Normalized account hierarchy and household structures to enable a 360° view.

Tech Stack Leveraged

Key Outcomes

40%

Faster onboarding of new business via standardized FSC record types

30%

Increased advisory-client interactions tracked through 360° structure

Improved

Compliance confidence through automated legacy-to-target validation controls

Case Study:

Policy operations transformation

Platform optimization through a dedicated Premium Support Team

The Challenge:

Mitsui needed to manage increasingly complex policy operations **across 11 lines of business and 50 states** while meeting aggressive release timelines. The existing shared support model struggled to keep pace with regulatory updates, defect volumes, and customization demands, impacting delivery efficiency and release predictability.

Transformation Goals:

- **Operational Scalability:** Support multi-line, multi-state policy operations with increased efficiency and throughput.
- **Predictable Release Delivery:** Improve coordination and execution of releases under tight schedules.
- **Platform Value Optimization:** Enable strategic customization and maximize the value of Insurity Policy Decisions.

Solution Approach:

Myridius implemented a dedicated Premium Support Team (PST) model, combining domain expertise, structured delivery, and quality engineering.

- › **Unified Delivery Model**
Established a dedicated PST acting as a bridge between Mitsui and Insurity, aligning priorities and ensuring focused execution.
- › **Business-Aligned Prioritization**
Enabled “right work at the right time” by prioritizing regulatory updates, defect fixes, and high-value enhancements based on business impact.
- › **Quality-First Engineering**
Introduced targeted QA strategies to reduce defects and enhance release stability.

Tech Stack Leveraged

Key Outcomes

100%

On-time releases ensuring predictability

57%

Backlog reduction with better collaboration

53%

Increase in overall log throughput

Case Study:

Enhanced underwriting decisions

Hyperautomation of underwriting through integrated data pipelines & optimized workflows

The Challenge:

MGIC was unable to achieve expected levels of touchless underwriting due to **fragmented external data** integration, internal data quality issues, and delays in processing new data sets. These constraints led to excessive exception handling, slowing decision-making and limiting automation effectiveness for standard underwriting cases.

Transformation Goals:

- **Automation Throughput Increase:** Improve the ratio of auto-underwritten versus manually reviewed cases for standard scenarios.
- **Integrated Data Ecosystem:** Enable reliable ingestion and harmonization of third-party, market, and government data sources.
- **Data Quality and Processing Efficiency:** Reduce data inconsistencies and eliminate delays impacting automated decision workflows.

Solution Approach:

Myridius designed and executed a hyperautomation-driven transformation to enable scalable, data-driven underwriting.

- › **Automated Data Integration**
Implemented scalable pipelines to source, ingest, and harmonize third-party, market, and government data into the underwriting engine.
- › **Data Quality Engineering**
Identified and remediated data issues, reducing exception handling and minimizing manual intervention triggers.
- › **Optimized Decision Workflow**
Streamlined data processing and ingestion cycles to accelerate underwriting decisions and improve throughput.

Tech Stack Leveraged

Key Outcomes

Increased

Touchless transaction volume with higher auto-underwriting rate

Faster

Decision cycles improved underwriting turnaround time

Reduced

Manual intervention by shifting focus to exception cases

Global Data Platform & Digital Transformation

Strategic technology partnership, cloud platform migration, application modernization, and data intelligence globally

Engagement Snapshot

 7+	 17+	 10+	 Global
Years of partnership	Certified engineers & specialists	Active workstreams managed	Global footprint

Domains transformed

						
Supply Chain Logistics	Warehouse Management	Operations Planning	Quality Engineering	Data Platforms	Compliance & Security	Reporting & Analytics

Product engineering tools

Snapshot of Martin Brower case studies

Consolidation

Rewrote and consolidated codebases into a single cross-platform framework for Android and iOS, **saving maintenance efforts by 30%**.

Cross-platform app rewrite

Automation

Streamlined regional operations by supporting workflow automations on Microsoft Power Platform **cutting manual overheads by 25%**

Low-code workflow automation

Rationalization

Transitioned to Power BI and decommissioned Cognos DWH, **achieving 100% retirement goal**, eliminating legacy licensing costs.

Legacy platform retirement

Migration

Migrated **4,000+ tables & 700+ pipelines** to Azure/Snowflake, expanding the platform resulting in **higher ROI**

Enterprise cloud migration

Optimization

Migrated EDW data flows to Snowflake Snowpark to **reduce cloud costs & optimize** large-scale data transformation runtimes.

Compute cost optimization

Visibility

Standardized global operational reports and supply chain metrics for **near real-time operational visibility & quality control**

Business intelligence & analytics

Case study:

Modernizing for a data driven business model

End-to-end cloud data platform modernization of legacy systems to Azure/Snowflake

The Challenge:

Martin Brower's Global Data Platform relied on Cloudera and legacy Cognos DWH systems suffering performance degradation and escalating costs. The platform needed to serve 8+ global regions with 24x7 reliability while continuously onboarding new data sources.

Transformation Goals:

- **Cloud Migration:** Transition all tables and pipelines from Cloudera to Azure ADF and Snowflake.
- **Legacy Decommission:** Retire Cloudera, and Cognos DWH, eliminating legacy licensing and operational overhead.
- **Operational Continuity:** Maintain 24x7 global data availability while expanding ingestion capacity to new sources.

Solution Approach:

Myridius led the full lifecycle migration of Martin Brower's Global Data Platform from on-premise Cloudera to a cloud-native Azure/ADF/Snowflake architecture, serving 8+ global regions with 24x7 reliability.

- › **Global Data Lake Migration**
Led end-to-end migration of 4,000+ tables and 700+ pipelines from Cloudera to Azure ADF and Snowflake.
- › **24x7 Global Support Model**
Established dedicated 24x7 support and managed services for the Global Data Platform across all regions.
- › **Ingestion Template Optimization**
Built parameterized ingestion templates and enhanced the Object Generator tool to reduce pipeline development time.
- › **Legacy System Decommission**
Fully retired Cloudera and Cognos DWH, achieving 100% legacy system retirement on schedule.

Tech Stack Leveraged

retired

Case Study:

Enabling point of delivery reliability for global supply chain

Point of delivery app rewrite and web upgrade used by delivery & logistics personnel

The Challenge:

Martin Brower's PDA Mobile and Back of House Web applications, supporting DC operations across NA, CA, and UK, were built on aging legacy stacks - unable to support Android and iOS simultaneously.

Transformation Goals:

- **Application Rewrite:** Migrate PDA Mobile apps to React Native for cross-platform (Android & iOS) support across NA, CA, and UK.
- **Web Modernization:** Upgrade Back of House Web apps to latest Angular, Spring Boot, and Java/Hibernate/Tomcat versions.
- **DevOps Enablement:** Implement Azure DevOps CI/CD pipelines and formal Integration, Regression, and UAT testing practices.

Solution Approach:

Myridius upgraded Martin Brower's PDA Mobile apps to React Native and modernized Back of House Web apps to the latest Angular, Spring Boot, and Java stack across NA, CA, and UK.

- › **React Native Mobile Rewrite**
Rewrote PDA Mobile apps in React Native for NA, CA, and UK - enabling unified Android and iOS support across all regions.
- › **Web Stack Upgrade**
Upgraded Back of House Web apps to latest Angular, Spring Boot, Java, Hibernate, and Tomcat for improved performance and security.
- › **Azure DevOps CI/CD**
Implemented automated CI/CD pipelines for builds, testing, and deployment; established formal Integration, Regression, and UAT testing.
- › **24x7 On-Call Support**
Established 24x7 on-call support model for P1/production issues with rapid SLA response across all supported regions.

Case Study:

Assuring frictionless driver services 24x7

24x7 global managed services across time zones

The Challenge:

Martin Brower's Global Data Platform requires around-the-clock support across multiple time zones, handling incidents from pipeline failures and access requests to source data quality issues - all requiring rapid, informed resolution without impacting global operations.

Transformation Goals:

- **24x7 Coverage:** Build a global support team covering all MB regions (US, CA, ANZ, UK, France, LAMEA) for continuous platform availability.
- **Knowledge Management:** Establish a Confluence-based runbook repository for recurring issues, enabling faster onboarding and first-contact resolution.
- **Structured Incident Management:** Implement ServiceNow ticketing with severity-based SLAs (P1/P2/P3) and escalation paths across all regions.

Solution Approach:

Myridius operates a 24x7 global managed services model for Martin Brower's GDP - managing incidents, platform health, and continuous improvement with a significantly higher direct resolution rate.

- › **24x7 Global Support Team**
Dedicated team covering all MB time zones; classifies, triages, and resolves incidents across all GDP regions.
- › **ServiceNow Incident Management**
All incidents tracked in ServiceNow with severity-based SLAs; 550+ incidents managed in 2024, 87% resolved directly by the team.
- › **Confluence Knowledge Repository**
Detailed runbooks and resolution guides for recurring issues; accelerates first-contact resolution and team onboarding.
- › **IR Failover Architecture**
Configured Azure EAST 2 ↔ CEN region failover for critical GDP pipelines, ensuring zero-downtime resilience.

Snapshot of Scouting America case studies

Modernization

Migrated legacy Oracle-based systems to cloud infrastructures under resource constraints to **establish a stable digital foundation.**

Legacy database migration

Optimization

Established location-rationalized QA operating model to support US day-shifts, for **cost-effective & highly responsive QA services.**

Offshore QA services

Sustenance

Delivered long-term application maintenance, support, and incremental feature updates to **maintain core platform stability.**

Core application maintenance

Consolidation

Advised on a **unified enterprise architecture** on AWS, consolidating into a single ODS to prevent nightly batch-job failures.

Enterprise database consolidation

Governance

Implemented MDM to **clean and consolidate duplicate data** across systems into a single verifiable source.

Master data governance

Growth

Scaling up the innovative conversational AI engine to handle online ordering, **to grow enrollment share 5x from 2% to 10%.**

Conversational commerce expansion

Case Study:

Agentic customer journey transformation

AWS native multi-agent AI assistance for scouts enquiries and enrolment journeys

The Challenge:

Scouting America's websites had zero search or knowledge-base capability. Families faced a confusing 25-minute enrollment with high abandonment rates. Local helpdesks were overloaded with basic Q&A. Conversational enrollment sat at 0%.

Transformation Goals:

- **Reduce Enrollment Friction:** Replace paper-based, screen-by-screen signup with a conversational AI journey.
- **Offload Helpdesks:** Provide instant, accurate, 24/7 answers on programs, merit badges, and unit locations.
- **Drive Digital Membership Growth:** Grow conversational enrollment share toward a 10% target (5× current 2%).

Solution Approach:

Myridius designed and built Scoutly - a GenAI-powered, multilingual enrollment assistant on AWS - eliminating search gaps and transforming a 25-minute enrollment into a 5-minute conversation.

- › **AWS-Native GenAI Platform**
Built on Amazon Bedrock (Claude Haiku 3.5), Lambda, EC2, RDS, DynamoDB, S3, and Kendra - multilingual support across English, Spanish, Arabic, French and more.
- › **Agentic Enrollment Workflow**
Guided step-by-step membership enrollment with contextual awareness and MCP integrations for password resets, unit-finding, and backend transactions.
- › **Conversational Knowledge Base**
24/7 coverage of 130+ merit badges, program questions, and unit-finding on Scouting.org and BeAScout.org - replacing zero-search WordPress sites.
- › **Marquee case study for Amazon AWS** available on [AWS Public Sector Blog](#)

Case Study:

Single view of members & data democratization

Data unification, analytics & reporting including data lake and MDM implementation

The Challenge:

Scouting America operated 5-6 siloed databases with point-to-point integrations causing duplicate records, nightly SSIS job and stored procedure failures, and inconsistent cross-system reporting. No unified analytics view existed across operational systems.

Transformation Goals:

- **Single Source of Truth:** Break down silos and consolidate all operational data into one authoritative ODS.
- **Eliminate Outages & Tech Debt:** Remove brittle nightly jobs, stored procedure failures, and data drift between systems.
- **Enable Real-Time Analytics:** Feed near-real-time transactions to Data Lake and Warehouse for synchronized operational dashboards.

Solution Approach:

Myridius designed an AWS-based Enterprise Integration Management platform - consolidating 5-6 siloed databases into a single ODS with CDC pipelines, MDM, Data Lake, and real-time analytics.

- › **Unified Operational Data Store (ODS) on AWS**
Single authoritative store replacing 5-6 siloed operational databases - all transactions in one place, eliminating nightly SSIS job failures and data inconsistencies.
- › **Master Data Management (MDM) & CDC Pipelines**
MDM consolidates duplicate citizen records (e.g. multiple profiles of same scout) into one golden record. Change Data Capture streams transactions near-real-time to the Data Lake and Warehouse.
- › **Unified Analytics & Reporting Layer**
Enables cross-system operational reports and near-real-time dashboards synchronized at the second - replacing fragmented, delayed multi-system pulls.

Technology Stack Leveraged

Key Outcomes

~80%

Reduction in database endpoints (5-6 silos → 1 ODS)

100%

Data alignment: reports & dashboards in sync

Real-time

Cross-system operational reporting via CDC pipelines

Case Study:

Member experience assurance & modernization

Shared services model for QA and support including data modernization

The Challenge:

Scouting America needed a cost-effective, reliable engineering partner to sustain legacy as well as modern platforms and support application development through a decade of severe financial constraints, restructuring, and transitions - without disrupting national operations.

Transformation Goals:

- **Operational Stability:** Maintain 24/7 platform uptime for 1M+ member organization with zero disruption to national programs.
- **Cost Efficiency:** Deliver quality engineering support within strict budget constraints using hybrid offshore model.
- **Trust Foundation:** Build credibility through consistent delivery - enabling later co-creation of AI and data transformation programs.

Solution Approach:

Myridius has delivered 13 years of continuous offshore QA, testing, and application managed services through restructurings, transitions, and major digital transformation initiatives.

- › **Hybrid Offshore QA Delivery Model**
Philippines-based team working US day-shifts provided high-quality, cost-effective testing and application development - purpose-built to fit Scouting America's constrained budget during bankruptcy restructuring.
- › **Platform Continuity Through 7 CIO Transitions**
Delivered uninterrupted platform maintenance and incremental development across multiple changes - each transition managed through direct C-suite alignment to preserve engagement continuity.
- › **Legacy Oracle Migration & Long-term AMS**
Led migration from legacy Oracle-based systems to modern platforms, followed by decade-long application maintenance, onshore/offshore support, and incremental feature development.

Analytics ready Data & AI

Faster access to analytical data within a seamless and cost-effective cloud environment

The Challenge:

- To support its **“One Digital” strategy**, the client needed faster access to analytical data within a seamless and cost-effective cloud environment. The status quo limited agility and scalability. The desired state was a hybrid model that could integrate on-premise systems with cloud services and support efficient, timely, data-driven decision-making.

Transformation Goals:

- Accelerate access to analytical data** in support of the client's digital strategy.
- Build a **seamless, scalable hybrid environment** integrating on-premise systems with AWS.
- Establish a **secure, production-ready cloud foundation** for cost-effective data workloads and advanced analytics.

Solution Approach:

Myridius designed and operationalized a hybrid environment integrating on-premise infrastructure with AWS.

- Data architecture design**
Architected a hybrid environment to enable seamless data flow and operational efficiency across on-premise and AWS environments.
- Cloud data lake**
Evaluated AWS components and piloted a cloud data lake to centralize storage and support advanced analytics.
- AWS based data foundation**
Operationalized AWS for data workloads and built a secure, production-ready foundation aligned to evolving business demand.

Case Study:

Enterprise data marketplace

Collibra-powered enterprise data catalog establishing a unified governance foundation

The Challenge:

Our client, managing complex operations across supply chain, manufacturing, finance, legal, and regulatory functions faced a deeply fragmented data landscape — siloed across business units with inconsistent metadata quality, redundancies, and no authoritative definitions. As AI and ML initiatives scaled, the absence of a governed, unified data foundation became a critical barrier to confident, compliant AI deployment.

Transformation Goals:

- **Authoritative Data Foundation:** Establish a Collibra-powered enterprise data catalog as the single source of truth for data definitions, types, and rules across all business units and systems.
- **Unified Persona Visibility:** Deliver tailored, role-based data views for Business Stewards, Technical Stewards, and Business Analysts to drive cross-functional data literacy and accountability.
- **AI Governance Enablement:** Build a compliant governance framework enabling AI/ML teams to deploy solutions with ethical and regulatory confidence at enterprise scale.

Solution Approach:

Myridius combined Collibra platform implementation with metadata remediation and organizational change management.

- **Data Catalog Implementation**
Deployed Collibra as the authoritative hub for enterprise data definitions — integrated with the existing business glossary and enterprise data lake.
- **Metadata Remediation**
Eliminated redundancies, corrected inaccuracies, and built ontologies and taxonomies to ensure consistent, high-quality metadata across all business units.
- **Governance Enablement**
Digitized data lake workflows and delivered structured training programs to embed data literacy and upfront governance enterprise-wide.

Tech Stack Leveraged

Key Outcomes

Unified data intelligence - consistent view of enterprise data assets

AI-ready foundation - governed, contextually rich data

Organizational data maturity - metadata stewardship as a sustained capability

Case Study:

Data governance & cloud modernization

Azure cloud, DW migration, data wrangling, reporting, analytics, data science enablement

The Challenge:

The client, a leading American regional banking institution, faced critical operational hurdles driven by legacy mainframe systems, fragmented data operations, and reliance on manual processes. Operating in a highly regulated environment, the bank was under mounting pressure to modernize aging infrastructure to improve agility and meet strict compliance standards.

Transformation Goals:

- **Modernize Infrastructure:** Migrate from legacy mainframes to a scalable Azure Cloud environment.
- **Enhance Security:** Improve fraud detection capabilities through better data federation.
- **Enable Compliance:** Establish a robust data governance framework to meet regulatory demands.
- **Optimize Operations:** Eliminate manual batch processing in favor of proactive, intelligent data operations.

Solution Approach:

Myridius executed a comprehensive data modernization program that transformed operations from reactive batch processing to proactive, cloud-native intelligence.

- **Cloud Infrastructure Modernization**
Migrating from rigid legacy mainframes to the Azure Cloud, implementing a modern Data Lake and Data Warehouse (DW) architecture
- **Fraud detection enablement**
Implemented data federation specifically designed for NICE Actimize
- **SAP S/4HANA Migration Support**
facilitated a low-risk migration to SAP Financials by implementing intelligent data quality processes.
- **Lightweight Data Governance**
developed and deployed a tailored, lightweight data governance framework.

Case Study:

Data platform modernization

Migrate their legacy Compass application to Microsoft Dynamics 365

The Challenge:

The client was challenged with modernizing its legacy Compass application by migrating to a modern cloud-based enterprise platform while ensuring seamless transition of business functionality and complex legacy data. The program required establishing a standardized, scalable data architecture with optimized and normalized data models, along with robust integration, transformation, and data lineage capabilities to support trusted downstream consumption.

Transformation Goals:

- **Standardize CRM platforms :** Single CRM platform built on Dynamics 365 which is easily extendable and high performing
- **Data architecture for the future:** Build a scalable & AI-ready data architecture for downstream data consumption & reporting
- **Meet compliance & regulatory requirements:** Build a data model to support RBAC, governance framework with auditability, catalog for visibility
- **Data tools standardization:** Implement the defined standardized tools for data loading, middleware, transformation & lineage for data movement

Solution Approach:

Myridius performed a detailed discovery to design the future state architecture and data platform capabilities.

- **Data Platform Build**
Azure infrastructure setup with proper DevOps pipelines for code migration
- **Dynamics 365 migration**
Migrate member operations related data, based on analysis completed during discovery
- **Unified Data Model**
Standardized data model encompassing key objects such as Account, Contact, Product, Asset, and other related entities.

Tech Stack Leveraged

Dynamics 365

Key Outcomes

Migration to an extendable & high-performing platform (MS Dynamics 365)

AI-ready data architecture for downstream data consumption & reporting

Full data lake build of client's data lake platform using Medallion architecture

Case Study:

Agentic underwriting implementation

Implementation of an agentic underwriting architecture to redefine risk assessment, validation, and governance

The Challenge:

With a reliance on self-reported and inconsistent inputs, the existing underwriting process struggled with data integrity, manual bottlenecks, and pricing friction. The key challenges included: Data inconsistency & friction, manual document processing, non-deterministic outputs, & regulatory transparency gaps.

Transformation Goals:

- **Unified data:** Consistent data across the process for accurate pricing & claims settlement
- **Automated document processing:** Improve underwriting speed through more automated documents processing
- **Deterministic AI models:** Ensure AI models' output remains within strict regulatory & underwriting boundaries
- **Explainability:** Ensure explainability & fairness in AI-driven decisions to meet regulatory requirements

Solution Approach:

To address these issues, a multi-agent system was deployed to automate data ingestion, cross-verification, and reasoning while maintaining human oversight.

- **Multi-Agent Collaborative Architecture**
Develop various AI agents for data acquisition & validation agent, underwriting reasoning agent, adversarial critic agent
- **Continuous Learning Loop**
Post-bind and claims outcomes are fed back into the system for risk scoring adjustments and agent performance tuning.
- **Human-in-the-Loop Orchestrator**
Ensures final binding authority remains with human underwriters to meet regulatory mandates.

Tech Stack Leveraged

Key Outcomes

30-50%

REDUCED

Leakage – min. financial loss from incorrect property attributes

Case Study:

AI-led impact analysis

An AWS-hosted AI assistant utilizing Natural Language Processing (NLP) with GraphRAG

The Challenge:

HGV manages thousands of business rules governing vacation inventory pricing, allocation, and availability across 3,500+ properties and five brands. With these rules dispersed across databases, application code, and unstructured documents, analyzing change impacts is highly manual, creating a need for greater visibility into rule interactions and the ability to predict downstream effects on guest experience, availability, and revenue.

Transformation Goals:

- **Reduce manual effort:** of analyzing the impact of changes in business rules happening across properties & brands
- **Improve speed of impact analysis:** by providing an interactive user interface where users can converse in natural language
- **Better understand rules relationships:** Design an integrated system that can correlate historical rule changes to booking outcomes

Solution Approach:

To address these goals, Myridius collaborated with AWS to build a Generative AI based solution for change impact analysis with below features

- **Knowledge Graph using Neo4j**
Build a Neo4j based GraphRAG system to establish rule relationships
- **AI Rules Assistant**
Build a new UI page in the existing Azure application for users to interact with the AI assistant
- **Foundation Models (FMs)**
To interpret rule differentiation and contextual relationships retrieved directly from the GraphRAG

Tech Stack Leveraged

Key Outcomes

60-70%

Reduction in manual intervention for impact analysis

UNIFIED

Rules resource to natural query & validate using AI chatbot

INTUITIVE

System to analyze change impact through natural queries

Case Study:

Accelerating merchant intelligence

Unified dashboard and automated actions on Salesforce Data Cloud

The Challenge:

Merchant data was fragmented across multiple Salesforce ORGs and business units, limiting pipeline visibility, cross-sell execution, and consolidated brand performance reporting. Leadership needed a single, trusted merchant view with whitespace intelligence to target relationship management, standardize insights, and drive portfolio-wide revenue expansion.

Transformation Goals:

- **Unified Merchant Profile:** Consolidate merchant data across ORGs and business units into a unified Customer 360 view
- **Real-Time Dashboards:** Deliver real-time pipeline visibility and brand performance dashboards for senior leadership
- **Revenue Expansion:** Enable intelligent cross-selling via automated whitespace identification and calculated insights

Solution Approach:

Myridius built a unified merchant intelligence platform on Salesforce Data Cloud, integrating disparate sources through MuleSoft to deliver governed identity resolution, actionable dashboards, and automated actions.

- **Unified Data Foundation** Implemented Data Cloud across multiple ORGs to standardize identity governance and consolidate merchant profiles
- **Merchant 360 Dashboards** Delivered CRM Analytics views for product penetration, pipeline, and brand performance, including automated task creation
- **Revenue Expansion Engine** Activated calculated insights to identify whitespace and trigger targeted cross-sell opportunities

Case Study:

Revolutionized merchant onboarding

Unified onboarding workflow and automated sales intelligence program

The Challenge:

The global food and retail delivery leader struggled with fragmented onboarding systems that forced sales teams to juggle multiple tools, creating inconsistent workflows and heavy manual effort. The lack of a unified 360° merchant view limited visibility into onboarding status, store performance, and revenue opportunities, resulting in missed cross-sell potential, slow manual approvals, and high churn.

Transformation Goals:

- **Platform Unification:** Consolidate onboarding systems into a single Salesforce-based platform across SMB & Enterprise.
- **Real-Time Visibility:** Establish a complete 360° merchant view integrating onboarding, contracts, and support data.
- **Sales Acceleration:** Streamline quoting, pricing, and approvals through Salesforce CPQ to shorten cycles.
- **Intelligent Data Flow:** Enable secure, real-time data movement across systems using MuleSoft integration.

Solution Approach:

Myridius executed a unified Salesforce transformation program combining platform consolidation, sales process automation, and real-time data integrations to modernize merchant onboarding and sales intelligence.

- **Workflow Standardization** Deployed Salesforce Sales, Service, and Experience Clouds to consolidate fragmented tools into a single onboarding platform.
- **Sales Acceleration via CPQ** Implemented Salesforce CPQ to digitize product bundling, quoting, pricing, and approval flows, configuring guided selling.
- **Real-Time Data Connectivity** Leveraged MuleSoft to integrate Salesforce with ERP, contract management, and customer systems using API-led connectivity.

Tech Stack Leveraged

Key Outcomes

360°

Merchant view across ops with zero disruption to active business

2x

Improvement in customer retention

Onboarding lifecycle speed & sales productivity improvement

Case Study:

Accelerating student admission cycles

AI-Driven process automation and document verification modernization

The Challenge:

The institution struggled with manual admission workflows, fragmented communication channels, and siloed data repositories. Staff faced a significant backlog of routine status inquiries (60% of volume), while document verification processes took five days per application, resulting in delayed responses and a suboptimal prospective student experience during critical enrollment periods.

Transformation Goals:

- **AI-Powered Automation:** Implement intelligent agents to automate routine enquiry management and provide real-time updates.
- **Process Acceleration:** Dramatically reduce document verification timelines from 5 days to 1 hour.
- **Cost Optimization:** Optimize total cost of ownership by \$200K through strategic AI investments.

Solution Approach:

We orchestrated a comprehensive Salesforce-based solution leveraging native capabilities and cutting-edge AI agents to modernize the admission experience.

- **Standard-First Configuration** Utilized Salesforce Education Cloud native features to minimize custom development and ensure future maintainability.
- **AI Agent Deployment** Configured Agentforce to provide instant, accurate answers to student application status queries 24/7.
- **Intelligent Document Processing** Integrated Google Gemini with Salesforce to automate verification, reducing processing time to 1 hour.

Tech Stack Leveraged

Key Outcomes

\$200K

TCO savings with reduced manual processing & staffing efficiency

40%

Reduction in manual intervention

1 hr

Document verification speed down from 5 days

Case Study:

Transforming customer retention

Operationalizing churn prevention & QA audits with AI Agents

The Challenge:

A high-tech platform serving 120,000+ businesses faced churn risk that was difficult to detect early because signals lived across product usage, support interactions, onboarding, and commercial data. Customer teams often reacted only after cancellation intent surfaced, with no unified, predictive account-level risk view or consistent "save" playbooks.

Transformation Goals:

- **Predict Early & Explain:** Provide proactive churn prediction with clear, actionable risk reasonings
- **Standardize Mitigations:** Launch predefined save actions, clear ownership, and systematic closure tracking
- **Scale QA Operations:** Automate service audits and infer real interaction-based CSAT scorecards

Solution Approach:

Myridius unified cross-functional customer data using Salesforce Data Cloud and built agentic workflows with Agentforce to operationalize churn prevention and service quality at scale.

- **Customer Churn Agent** Produces churn-risk reports, timelines, citations, sentiment analysis, and recommended mitigation playbooks
- **Account Deep Research Agent** Blends internal product usage metrics with external web signals to flag red flags and construct targeted action plans
- **Service Audit Agent** Automates a 16-parameter scorecard and infers CSAT metrics to expand quality assurance coverage dynamically

Tech Stack Leveraged

Key Outcomes

15%

Churn reduction achieved

~60%

Reduction in first-level QA audit effort

Early

At-risk merchant detection backed by a prioritized queue with routed action tasks

Case Study:

Modernizing vacation ownership sales

Unified guest 360° view and real-time salesforce tour booking architecture

The Challenge:

The enterprise struggled with an over-customized legacy data model leading to high technical debt, low scalability, and poor adoption across Sales, Service, and Marketing. Data lived siloed across Salesforce, OMS, Parks, and Cruise systems, with no unified Guest 360° view. Inefficient selling was worsened by lack of real-time booking availability, compliance checks, and household context.

Transformation Goals:

- **Standard-First Foundation:** Replaced customized legacy models with standard OOB-aligned Salesforce architecture
- **Guest 360° Unification:** Consolidate siloed profiles across Parks, Cruises, and OMS into one unified guest view
- **Sales Velocity Acceleration:** Digitize tour bookings with instant availability and built-in compliance guardrails
- **Integration Simplification:** Replaced fragile point-to-point connections with a single integration fabric

Solution Approach:

Myridius executed a comprehensive strategic alignment program to consolidate siloed customer systems, automate tour booking, and deliver connected, real-time guest intelligence.

- **OOB-Aligned Architecture** Deployed standard Salesforce architecture to scale opportunity and task pipelines across clouds, eradicating custom technical debt
- **Real-Time Tour Bookings** Redesigned the entire booking experience into a single interface with automatic compliance checks and real-time inventory checks
- **Connected Guest Intelligence** Leveraged Data Cloud, Helix, and Einstein AI to deliver Next Best Actions and automated case intelligence on a unified profile

Tech Stack Leveraged

Accelerating digital execution

Consulting-first advisory, futuristic operating model, and CIO-aligned governance

The Challenge:

The global leader faced massive backlogs in P1 & P2 cases, complex org merges across Sales, Service, and Manufacturing Clouds, and a legacy waterfall structure. Operating scale was limited, and transitioning operational workflows away from an entrenched legacy incumbent partner presented major delivery and business continuity risks.

Transformation Goals:

- **Minimize Technical Debt:** Streamline support across Sales, Service, Experience, CPQ, and Manufacturing Cloud
- **Agile Modernization:** Shift from legacy waterfall delivery to high-productivity Agile sprints and backlog management
- **AI-Led Innovation:** Transition and scale advanced Gen AI capabilities across global operating companies
- **Smooth Knowledge Transition:** Conduct seamless partner transfers with zero disruption to active business lines

Solution Approach:

Myridius co-created a futuristic operating model and governance framework with the CIO, combining multi-cloud Salesforce support, Microsoft Gen AI expansion, and Agile delivery.

- **Salesforce Managed Services** Supported Sales, Service, Experience, CPQ, and Manufacturing Cloud. Transitioned knowledge smoothly and supported major org merges
- **Microsoft Gen AI Enhancements** Took over Microsoft ERP and Gen AI support, expanding model deployments to 4 out of 18 operating companies
- **Agile Delivery Transformation** Transitioned to sprint capacity management, robust backlog tracking, and unified governance across multiple delivery teams

Tech Stack Leveraged

Key Outcomes

70%

Reduction in P1 & P2 backlogs achieved within 2 months of steady state

8 weeks

Time to scale the co-created, cross-functional delivery team to full productivity

30%

Improvement in GTM speed driven by standard Agile frameworks

Case Study:

Insurance product testing automated from 3 days to 1 day

Automated Workers Compensation regression and smoke testing across state coverage

The Challenge:

Manual regression testing for Workers Compensation BCR took an average of 3 days with limited state coverage. No smoke testing was conducted, which delayed defect detection and created inconsistent test results across environments.

Transformation Goals:

- **Shorten Regression Cycles:** Reduce manual regression effort from 3 days to 1 day.
- **Expand Test Coverage:** Prioritize scenarios across Workers Compensation states and environments.
- **Establish Smoke Testing:** Add daily automated smoke runs with zero manual intervention.

Solution Approach:

Myridius designed an automation-led test operating model for Workers Compensation BCR, pairing prioritization, environment architecture, and daily smoke coverage.

Scenario Prioritization

Defined priority sequence using standard criteria for business-critical test scenarios.

Environment and Data Architecture

Designed target test environment architecture, data management processes, and implementation roadmaps.

Daily Smoke Tests and Weekly Regression Discipline

Implemented daily automation smoke test runs with zero manual intervention. Established weekly regression runs with proactive defect detection and attended off-shift execution.

Case Study:

AI-powered QA modernization across enterprise portals

Copilot-assisted script modernization and framework migration for banking portals

The Challenge:

Test automation was a severe bottleneck with significant time spent manually writing, maintaining, and refactoring scripts. Manual web element identification delayed sprints, while legacy Angular and monolithic APIs limited scalability across enterprise portals.

Transformation Goals:

- **Reduce Script Effort:** Use AI-assisted engineering to reduce manual script creation and refactoring.
- **Accelerate Migration:** Modernize Serenity and Eggplant frameworks into Karate without disrupting delivery.
- **Scale Enterprise Coverage:** Support multiple portals with repeatable validation, training, and compliance assurance.

Solution Approach:

Myridius combined GitHub Copilot-assisted engineering, PageScanner automation, and disciplined validation to accelerate QA modernization across multiple banking portals.

GitHub Copilot Engineering PoCs

Integrated Microsoft GitHub Copilot as an intelligent code assistant and executed proof-of-concept workflows. Created a PageScanner class for automatic web element mapping directly from Test Rail.

AI-Powered Code Refactoring

Executed AI-powered refactoring and migrated automation frameworks to Spring Boot 3 microservices.

Validation and Compliance Assurance

Ran peer review, regression testing, training, and compliance readiness checks using integrated build agents.

Technology Stack Leveraged

Key Outcomes

50%

Effort reduction in script development

60%

Faster migration from Serenity to Karate

70%

Migration acceleration from Eggplant to Karate

Case Study:

Regulatory QA efficiency at scale

qTest-enabled reuse and risk-based QA for ISO 2022 regulatory delivery

The Challenge:

Large-scale ISO 2022 Commercial Auto Class Plan implementation across all 50 states required coordinated enhancements across rating logic, class assignment, and forms. QA accounted for 35% of total effort, with fragmented testing pipelines and limited automation slowing release readiness.

Transformation Goals:

- **Reduce QA Effort:** Move QA from 35% to 12.5% of total effort through reusable tests and automation coverage.
- **Scale Reusable Testing:** Parameterize inputs and modularize qTest steps as regulatory rules changed.
- **Improve Release Readiness:** Align QA, LOB SMEs, and development teams for 50-state compliance coverage.

Solution Approach:

Myridius helped the client streamline Commercial Auto Class Plan QA by turning fragmented regulatory testing into a reusable qTest operating model for faster delivery.

qTest Reuse Model

Reusable test cases with parameterized inputs and modular steps for rating logic, class assignment, and forms.

Traceability and Risk-Based Coverage

Linked tests to imported requirements and rule interpretations, then prioritized execution by business and regulatory impact.

Cross-Functional QA Operating Rhythm

Early QA engagement and weekly checkpoints with QA analysts, LOB SMEs, and development teams.

Versioned Test Case Library

Versioned cases as rules evolved to maintain compliance coverage across all 50 states.

Case Study:

Enterprise QA framework unifies fragmented testing

Standardized governance, traceability, automation across legacy & distributed systems

The Challenge:

The enterprise faced a fragmented testing landscape across legacy and distributed systems. Inconsistent adoption of testing practices, manual test data creation, limited automation, and siloed teams created high manual effort, slower releases, inconsistent quality, and weak traceability across projects.

Transformation Goals:

- **Improve Test Coverage:** Establish a unified framework across UI, API, and data layers.
- **Reduce Defect Leakage:** Standardize governance, reviews, and traceability from requirements to test execution.
- **Optimize QA Resources:** Centralize QE practices and structured test data for consistent validation.

Solution Approach:

Myridius designed an enterprise QA architecture that brought legacy and modern systems into a common governance, traceability, and automation model.

› Enterprise QA Architecture

Designed a standardized QA framework across UI, API, and data testing for legacy and modern systems.

› Centralized QE Practice

Defined roles, processes, quality gates, playbooks, and onboarding materials to break down silos.

› Traceability and Governance

Aligned projects to business goals with structured traceability from requirements to test execution.

› Structured Test Data

Implemented comprehensive test data coverage for higher quality validation and repeatable execution.

Technology Stack Leveraged

40-60%

Increase in test and automation coverage

20-25%

Reduction in defect leakage

20-30%

Resource optimization

Consulting case studies

Modernizing data governance and cloud infrastructure for an American regional bank

Banking & Financial Services

Client
situation

The client faced pressure to modernize aging infrastructure, improve operational efficiency, and strengthen fraud detection in a highly regulated environment.

Solution

- Myridius delivered a data modernization program covering fraud data federation for NICE Actimize, SAP S/4 HANA migration, and cloud infrastructure modernization.
- The engagement also established intelligent data quality and an enterprise governance framework to support scalable transformation.

Outcomes

- **Operational excellence** through proactive data management
- **Enhanced fraud defense** with real-time detection
- **Proactive governance** for future innovation

Enabling a unified affiliate data ecosystem for better advisor experience and compliance

Banking & Financial Services

The client needed to unify affiliate data across systems to improve experiences, compliance, scalability, retention, and operational excellence.

- Built a cloud-native architecture to enable scalability, high availability, and continuous delivery
- Adopted an API-first design to support rapid onboarding of new data sources and real-time connectivity
- Established a governance framework with clear RACI and source system authority for trusted decision-making Source

- **Advisor satisfaction** through improved data accuracy
- **Competitive advantage** with real-time data access
- **Faster insights** for decision-making

Scaling engineering efficiency and standardizing delivery

Manufacturing & Digital Engineering

The client faced structural engineering debt and custom solution sprawl, slowing release cycles and hindering digital innovation scale.

- Myridius redesigned the DevOps lifecycle and defined common build patterns with modular components to eliminate redundant engineering effort.
- The team centralized asset cataloging and rationalized the global analytics platform against enterprise architecture standards to improve governance.

- **Reusability at scale** with 40% reusable assets
- **Portfolio alignment** with 50% meeting EA standards
- **Delivery velocity** unlocking faster, reliable release cycles

Consulting case studies

	Enabling enterprise architecture and standardizing governance for a global packaging company	Modernizing legacy inventory systems for a global vacation timeshare company	Upgrading the legacy scouting application architecture for an American youth organization
	 Manufacturing & Packaging	 Travel & Hospitality Services	 Non-profit & Youth Services
Client situation	The client lacked formal enterprise architecture governance and engagement processes, leaving their overextended team struggling to focus and deliver.	The client needed to replace legacy mainframes with a cloud-native, real-time reservation platform to enhance agility across global resorts.	The client needed to modernize its application to resolve API constraints, security gaps, and operational inefficiencies.
Solution	• Myridius provided enterprise architecture consulting and built scalable design patterns to right-size IT infrastructure and standardize governance. • The team engaged PMO to standardize the landscape, identifying redundant systems to support acquisition-led growth across 600+ applications.	• Myridius developed a cloud-native, API-first architecture to replace legacy systems, enabling real-time inventory synchronization and ecosystem integrations. • The engagement provided phased roll-out strategies, risk management, and robust governance frameworks to ensure security and compliance.	• Myridius utilized the AWS Well-Architected Framework to identify risks and recommended a modular three-tier API architecture. • The engagement also strengthened security with OAuth2 and TLS encryption while automating testing for improved performance.
Outcomes	• Portfolio visibility with 600+ mapped business applications • Cost reduction through HR system application rationalization • EA roadmap guiding towards a federated model	• Reduced latency through real-time inventory synchronization • Operational efficiency via automated bulk planning • Scalability using modular, CRS-agnostic APIs	• Performance enhancements ensuring sub-200ms API latency • Security improvements through robust data encryption • System reliability via proactive performance monitoring

AWS case studies

Cloud-Native Modernization of Disney Parks' Dining Reservation System

Client
situation

Legacy monolithic systems struggled with extreme traffic spikes, causing outages and disrupting guest experiences during high-demand 60-day advance dining reservation windows.

Solution

- Transitioned to cloud-native serverless architecture on AWS
- Employed Amazon EKS for decoupled microservices orchestration
- Utilized AWS Lambda for asynchronous event-driven tasks

Outcomes

- Supported **1.5 million searches**
- **Reduced latency** by 60%
- **Scaled** with near-zero cost impact
- Ensured highly **resilient availability**

Supported AWS Transformation & Ticketing Architecture Modernization

Volatile ticketing demand caused thundering herd events, making on-premises legacy data centers prohibitively expensive and operations sluggish during peak ticket sales

- Supported migration of corporate applications on Amazon Elastic Container Service
- Supported Virtual Waiting Rooms at the network edge
- Integrated Datadog and BigPanda for advanced AIOps observability

- **Reduced TCO** by 58%
- **Improved build times** 15x
- **Throttled** massive **bot traffic**
- **Lowered** global network **latency**

Real-Time Fraud Detection Engine Modernization on AWS

Legacy Teradata and mainframe systems struggled with latency, detecting fraud after transactions instead of during the authorization window for 4,000 TPS

- Built hybrid event-driven architecture using a sidecar pattern
- Used Amazon MSK for real-time transaction event ingestion
- Deployed H2O machine learning models directly on ECS

- Handled **4,000 peak TPS**
- **Savings** of over \$10 million
- 42% **faster** case **resolution**
- Achieved >90% alert **accuracy**

Azure case studies

Cloud-Native Platform for Emergency Medicine Certification

American Board of
Emergency Medicine

Healthcare

Client
situation

The board faced mounting pressure from physicians demanding a modernized certification process while legacy system limitations put NCCA accreditation at risk.

Solution

- Migrated the entire certification platform to Microsoft Azure cloud.
- Built modern services layer architecture for workflow management.
- Deployed Azure Data Factory and Synapse for AI-driven dashboards.

Outcomes

- **Strengthened** NCCA accreditation readiness.
- Deployed features **60% faster**.
- Achieved **99.9%** system **uptime**.
- **Reduced support tickets** 50%.

Cloud Migration and Unified Data Architecture

Banking & Financial Services

A regional bank struggled with rigid mainframe constraints, disconnected data silos, and manual reporting processes that delayed critical business decision-making.

- Migrated the data infrastructure to Microsoft Azure cloud.
- Consolidated data silos into a modern data warehouse.
- Implemented a custom lightweight data governance framework.

- **Automated** manual data tasks.
- Streamlined enterprise **reporting efficiency**.
- Ensured strict **regulatory compliance**.

Transforming Digital Health Ecosystem with Azure Architecture

Healthcare

An expansive physician clinic and hospital network struggled with fragmented digital experiences, legacy workflows, and security risks across its 850 locations.

- Developed React Native employee app for schedule tracking.
- Unified patient engagement integrating Epic and MuleSoft on Azure.
- Utilized Azure Kubernetes and Azure B2C for orchestration.

- **Unified** surgeon lifecycle **workflows**.
- **Sustained** peak exam loads.
- **Secured** identity and governance.

Case Study:

Real-time Fraud Intelligence

Event-driven, ML-powered fraud detection platform with intelligent case management

The Challenge:

Escalating fraud threats and an aging on-premise data architecture hindered real-time threat containment for the client processing 4,000+ transactions per second. The client's legacy Teradata-based warehouse generated excessive false positives, missed novel fraud patterns, and restricted advanced risk analytics, while requiring a massive 50TB data migration without impacting live transactional operations.

Transformation Goals:

- **Fraud Reduction:** Dramatically reduce financial losses through intelligent, real-time ML-based fraud detection and automated intervention.
- **Platform Modernization:** Migrate 50TB legacy Teradata data warehouse to a scalable, cloud-native Hadoop and Snowflake analytics platform.
- **Operational Efficiency:** Enhance investigator productivity through automated case prioritization and cognitive workflow dashboards.
- **Analytics Foundation:** Establish a continuous feedback loop to refine ML models, reduce false positives, and improve detection accuracy over time.

Solution Approach:

Myridius delivered an event-driven fraud interdiction platform to maximize transaction security and real-time operational visibility.

- › **ML-Powered Decision Engine**
Deployed an H2O-based Gradient Boosted Trees ensemble model as a high-speed JAR to achieve sub-millisecond scoring and ROI-optimized transaction intervention.
- › **Event-Driven Streaming Architecture**
Built a Confluent Kafka platform integrating legacy IBM MQ with real-time KSQL processing to orchestrate enterprise-secured data streams.
- › **Cognitive Case Management & Cloud Migration**
Implemented configurable alert thresholds and auto-escalation for high-value transactions and built investigator dashboards alongside a zero-disruption, sidecar-modeled 50TB migration from legacy Teradata to Snowflake and Hadoop.

Tech Stack Leveraged

Key Outcomes

\$10M+

Net annual fraud loss reduction with automated real-time intervention

42%

Faster case resolution through cognitive case workflows

>90%

Alert accuracy increasing focus on genuine threats, reducing alert fatigue

Case Study:

Agentic Vendor Operations

Deterministic, AI-powered evaluation workflow for smart contract vendor RFPs

The Challenge:

The client's vendor evaluation for smart contract development and auditing was high-impact, high-risk, and slow. Procurement teams worked through lengthy proposals with inconsistent scoring practices and multi-day review cycles that depended heavily on manual interpretation creating a clear operational gap where decisions had to be fast, fair, and defensible.

Transformation Goals:

- **Accelerate Evaluation:** Turn multi-day manual review cycles into near-real-time, system-assisted vendor assessment.
- **Standardize Scoring:** Apply a deterministic, rubric-based framework so results are consistent across evaluators and submissions.
- **Strengthen Governance:** Generate immutable audit trails with full reasoning traceability for compliance defensibility.
- **Scale the Engine:** Build a foundation that supports new criteria, categories, and procurement use cases with minimal rework.

Solution Approach:

Myridius delivered an enterprise-grade AI application with a Dynamic Agent Factory architecture that creates specialized micro-agents at runtime for each evaluation dimension.

- › **Dynamic Agent Factory**
Specialized micro-agents created at runtime each scoring one dimension (compliance, pricing, security, technical quality) in parallel with strict cognitive isolation.
- › **Deterministic Scoring Framework**
PDF, CSV, and text inputs normalized into structured content, then scored against bounded, rubric-aligned criteria for consistent ranked vendor outputs.
- › **Enterprise Control & Auditability**
JWT auth, RBAC enforcement, append-only audit logging, and model version controls - every score traceable to documented criteria with full reasoning visibility.

Tech Stack Leveraged

Key Outcomes

Near-Real-time

Scoring compressed from days of manual review

100%

Auditable, rubric-aligned scoring across every evaluation dimension

Scalable

Foundation extends to new criteria without redesign

Case Study:

2-Minute Commercial Onboarding

Omni-channel commercial account opening on Temenos Journey Manager & AWS

The Challenge:

The client relied on a slow, largely manual onboarding model that took about two weeks to open a new commercial deposit account. They needed an intuitive omni-channel journey supporting relationship managers, self-service users, and multiple product lines while accelerating growth and reducing operational friction.

Transformation Goals:

- **Unified Journey:** Build one intuitive omni-channel onboarding experience for commercial clients.
- **Multi-Product Reach:** Cover deposit accounts, credit cards, lending, and treasury management services in a single flow.
- **Time to Account:** Collapse account-opening cycle time and remove channel-switching friction.
- **Scalable Growth:** Lay the foundation for scalable digital onboarding across business units.

Solution Approach:

Myridius delivered a unified digital onboarding and account-opening experience on Temenos Journey Manager + AWS with deeply integrated fintech services.

- › **Unified Multi-Product Journeys**
Designed information architecture, interaction design, and interface design for deposit, lending, cards, and treasury onboarding in one flow.
- › **Fintech Integration Layer**
Integrated Alloy, Middesk, iovation, and MX for identity, fraud prevention, business verification, and bank-account verification.
- › **Core Banking Connectivity**
Connected the experience to the bank's FIS IBS environment through a custom integration layer for real-time downstream processing.

Tech Stack Leveraged

Key Outcomes

5 months

Phase-one delivery accelerating digital onboarding

2 mins

Average time to open a new commercial account - down from two weeks

Rapid

Deposit onboarding supported during a critical market dislocation

Case Study:

Quality Engineering Modernization

Centralized QE operating model and enterprise transformation roadmap

The Challenge:

The client was running large modernization programs needed to transform testing into a centralized, scalable, business-aligned Quality Engineering function. Fragmented project-owned testing, inconsistent standards, minimal automation, and no centralized governance left the organization at a "Repeatable but not Defined" maturity level - high effort, low predictability.

Transformation Goals:

- **Centralize QE:** Replace fragmented, project-owned testing with a unified enterprise-wide QA operating model.
- **Standardize Processes:** Define consistent, documented, scalable testing frameworks covering strategy, governance, automation, and data.
- **Advance Automation:** Build an enterprise automation strategy that cuts manual regression and accelerates release cycles.
- **Governance & Visibility:** Implement central quality metrics, dashboards, and reporting for proactive risk management.

Solution Approach:

Myridius ran a comprehensive QE maturity assessment and delivered a strategic transformation blueprint centered on a centralized QA model.

- › **Centralized QA Operating Model**
Unified QE function delivering shared services, standardized practices, and strong governance across every business unit.
- › **Master Test Strategy & Automation Roadmap**
Customizable test strategy framework plus a scalable functional and non-functional automation model to cut manual regression.
- › **Data Strategy & Quality Metrics**
Improved test-data availability and reliability with enterprise quality dashboards, KPIs, and governance for proactive decision-making.

Tech Stack Leveraged

Automation Tools | Test Management | Test Data | CI/CD | Enterprise Platforms

Key Outcomes

QA Model

Unified enterprise QE function replaces fragmented testing

Strategy

Standardized test strategy, governance, and automation playbook

Quality

Dashboards and KPIs enable defensible, business-aligned release decisions

Case Study:

Frictionless Digital Onboarding

Unified onboarding journey across client's entire banking product suite

The Challenge:

The client needed a single digital account-opening experience spanning its entire suite of banking products across millions of customers and hundreds of branches. The work began as a Proof of Concept and had to honor existing style guides so the look and feel stayed consistent with what their customers already expected, before scaling into a full application build.

Transformation Goals:

- **Unify the Journey:** Consolidate disparate banking products into a single, unified digital account opening journey.
- **Flexible Framework Adoption:** Maximize platform extensibility using modern React-driven Open UX frameworks.
- **Brand-Consistent UX:** Maintain the bank's established visual identity across custom transaction workflows and question trees.
- **Tailor by User Type:** Distinct user flows for each customer persona and product path.

Solution Approach:

Myridius engineered a unified, multi-product digital account opening framework to consolidate customer acquisition across the bank's complete product suite.

› End-to-End UX Design

User journeys, information architecture, interaction design, and interface design for client's entire suite of banking products in one journey.

› Fully-Functional POC Prototype

A demoable POC built to demonstrate the art of possible for internal stakeholder feedback.

› Custom Build on React & Temenos

Bundling logic and dynamic question flow built in React Open UI, with custom OpenUX API development and financial-system integrations on Temenos Journey Manager.

Tech Stack Leveraged

temenos

Core Banking & Financial Integrations

Key Outcomes

Multi-year

Partnership secured via a fully functional POC prototype

100%

Suite coverage by bundling all banking products into one application

Unified

digital acquisition framework consolidating all banking products across 6 states

Appendix

ServiceNow case studies

Creating a unified and scalable employee recognition ecosystem with ServiceNow

Client
situation

The client needed a scalable employee recognition solution to enhance engagement, address functional gaps, and support continuous innovation across business units.

Solution

- Myridius implemented the Cast Track application that is a tool built in ServiceNow to service employees across different areas of the client's businesses in requesting pins, service awards, etc.
- The solution included data migration from existing application along with validation and testing

Outcomes

- **Rapid search** for events / items
- **Persona-based** access control
- **Operational insights** within the system

Enhancing employee experience through intelligent HR service delivery

The client sought skilled functional and technical expertise to accelerate knowledge transfer, optimize solutions, and ensure operational continuity throughout the transformation.

- Our solution handled employee requests using case records, automated workflows, & SLA tracking
- Easy access to HR policies, FAQs & personalized portal
- ITID management system that allows users to view, update, and monitor the status of ITID assets ensuring better tracking and accountability of IT-related resources

- Improved **employee experience**
- Faster **service resolution**
- Accelerated **workforce enablement**
- Enhanced **operational resilience**

Service delivery modernization with ServiceNow

The client aimed to modernize service delivery through intelligent workflows and automation to enhance user experience, streamline operations, and enable proactive service management.

- Automated onboarding of new carrier
- Implemented and customized ITSM and CSM modules
- Developed custom portals & chat features using ServiceNow
- Created REST APIs and scripted solutions to automate workflows and integrate with other systems

- Accelerated **carrier onboarding**
- Enhanced **user experience**
- **Real-time engagement**
- Automated **service operations**

Transformation focused delivery @ U.S. Bank

Key milestones

Outcomes delivered

Merchant experience uplift

Drove scalable and AI-powered roadmap to streamline merchant experience across the lifecycle

Cost optimization

AI-led delivery driving efficiencies across product engineering, QE and support combined with systemic resilience frameworks to operate at scale

Payment modernization

Transformation across merchant payment product suite; digital wallet, BNPL, POS, Bill management, cards (debit/credit), Anti money laundering, etc.

Delivered outcomes across payments product suite

ENGAGEMENT HIGHLIGHTS

85% of all applications in MPS are tested by Myridius

70% overall automation coverage

<1% defect leakage to production due to testing miss

4x acceleration in overall Quality Engineering velocity

\$3M+ investment by Myridius in the last 3 years

\$4M savings with 32 Agilist covering 80 product teams

Payments Product Suite

Merchant onboarding

- Merchant Self Registration
- Merchant boarding enhancement
- Unified Gateway Product setup
- Anti-Money Laundering rules set-up
- Buy Now Pay Later enablement

POS payments

- Tip collection simplification
- POS simplification
- Image Printing on Pay@Table EMV and Final Detailed Receipt
- Enabled flexibility for customers when giving tips

Contactless

- Unified gateway enhancement
- Virtual purchase card payments simplification

Digital payments

- Development of portal APIs for USB prepaid cards
- Deployed prepaid card solutions aligned to Elavon's payments strategy
- A/c to a/c bank transfers enablement
- Credit card core app testing (Axis / MPS)

Payment gateways

- Deployed MFA/OTP for login via e-mail
- Digital wallet capability (Apple Pay / Google Pay on Web)
- Improved CX with Buy Now Pay Later capability enhancements
- Migration of app components to React

Payment optimization

- DCC / MCC setup and transaction processing
- Debit card transaction security enhancement with PIN feature
- Original Credit Transaction enablement
- Commercial Card Optimization

Security and PCI compliance

- Secured Applications - Eboarding NA and EU, Payments Insider, Elavon Connect
- Encryption, PCI, Token Vault
- Blackduck/Fortify Scans/Vulnerability Remediation
- PCI compliance for all product areas

Value added services

- Dynamic Currency Conversion capability development
- BNPL enablement and ecommerce plugin development; Shopify, WooCommerce
- Real Time Payments enhancements
- Subscription and Bill Mgt. System deployment

Reporting and management

- 360-degree SLA visibility
- Jboss upgrade
- ServiceNow CSM Integration
- AMQ decommissioning
- SFTP file transfer enablement for clients
- Enhancements to Elavon connect
- DMR and MCP (sunset)
